PORTFOLIO CASE STUDY

Digital Marketing for an AI Traffic Management System

B2G acquisition, measurement, privacy and AI governance

SPIROS GROUZTIDIS

Public English edition, October 2026

A marketing decision system, not a product claim

What it answers

Which channels and evidence assets support a municipal pilot conversation, and how should results be measured?

What it contains

A B2G funnel, synthetic campaign data, KPI calculations, budget recommendations, and governance controls.

What it excludes

Real customers, production traffic data, legal conclusions, causal lift, and verified traffic-system performance.

Decision question

How should a supplier market a controlled AI traffic pilot to European public buyers while preserving evidence quality, privacy, procurement readiness and accountable human review?

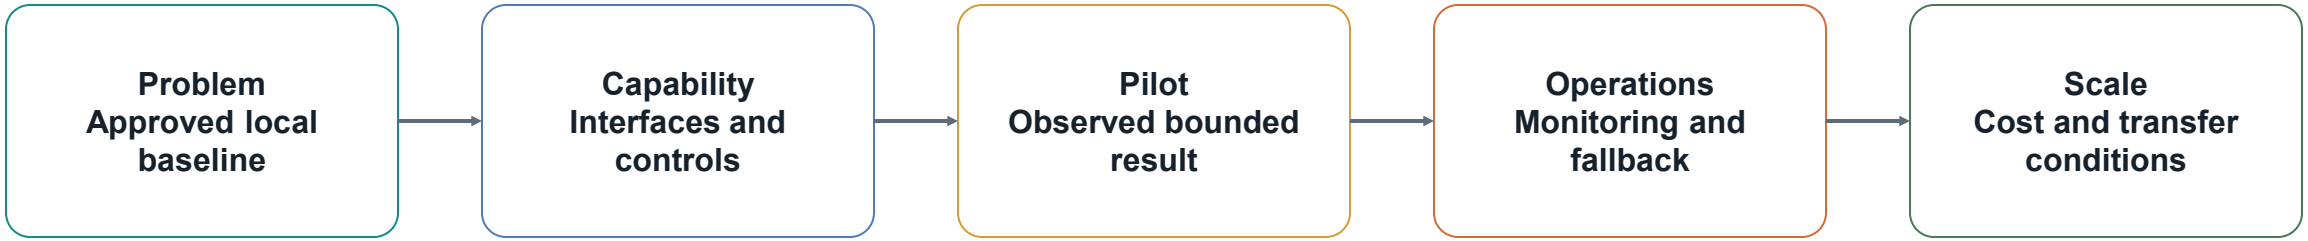

Urban mobility creates an evidence-led opportunity

Policy direction

European policy supports integrated urban mobility planning, measurable indicators, sustainable transport and digital traffic-management solutions.

01	**Local baseline**	Define the congestion, safety or reliability problem before selecting technology.
02	**Controlled pilot**	Use bounded scope, acceptance measures, monitoring, fallback and human override.
03	**Procurement evidence**	Document value, uncertainty, ownership, exit conditions and scale criteria.
04	**Governed claims**	Market only the capabilities and outcomes supported by owned evidence.

The offer is a controlled pilot with proof

Recommended public message

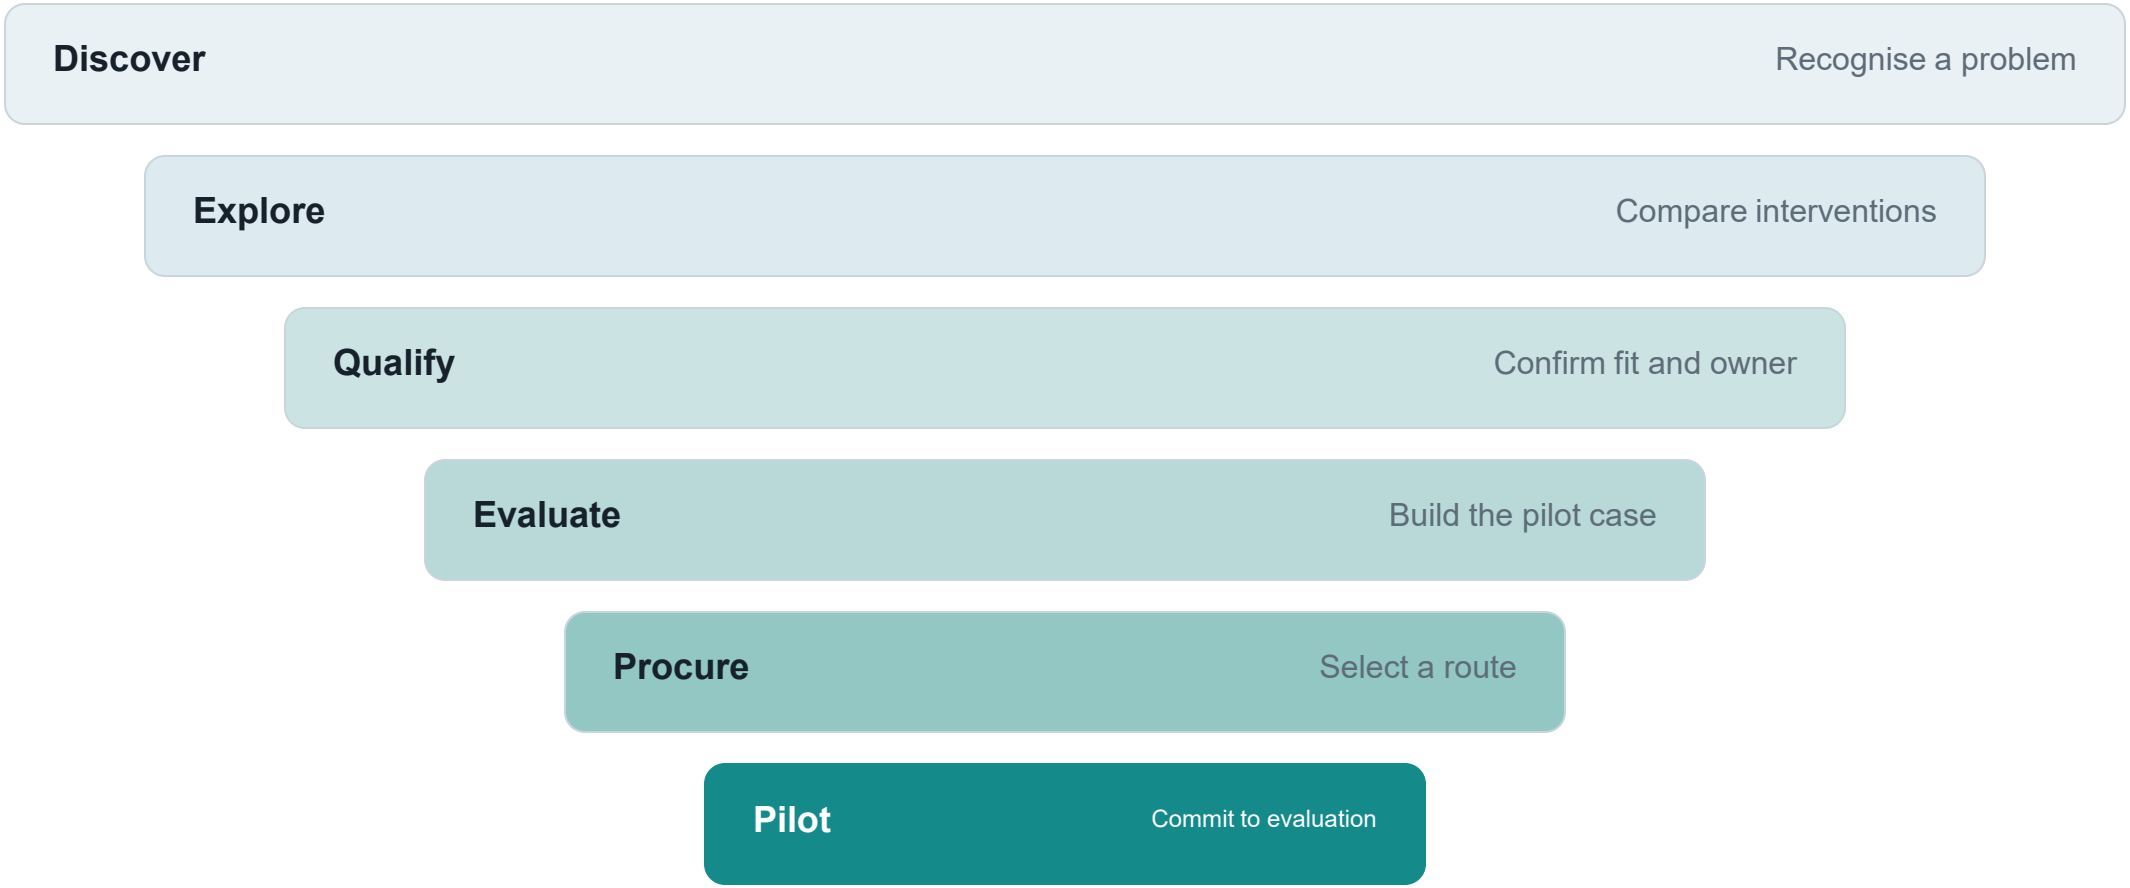

Test whether adaptive traffic management can improve agreed local outcomes inside a bounded pilot, with explicit baselines, human override and transparent evaluation.

A municipality buys through a committee

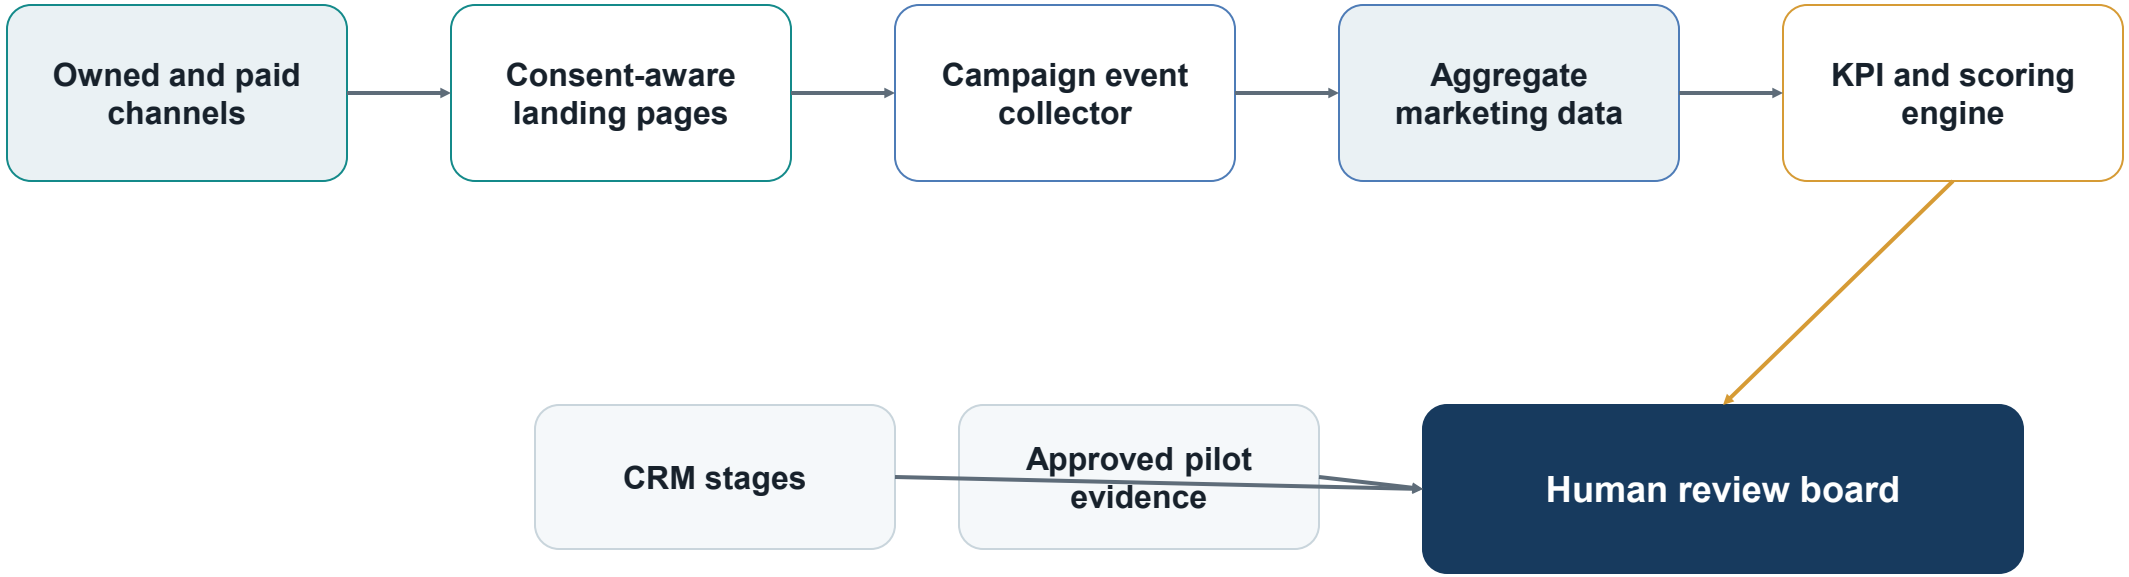

Role	Primary concern	Evidence needed
Executive sponsor	Public value and accountability	Baseline and citizen outcome
Mobility owner	Safe and reliable operation	Pilot boundary and fallback
IT and security	Integration and resilience	Architecture, logs and recovery
Procurement	Fair competition and value	Scope, criteria and exit terms
DPO and legal	Lawful and proportionate use	Data map and assessment triggers
Finance	Affordability and uncertainty	Cost range and sensitivity

A qualified opportunity needs an operational owner, accountable sponsor and a plausible procurement path.

The funnel follows the public buying journey

Measurement stays separate from traffic operations

No raw camera feeds, vehicle identifiers, location histories or resident profiles enter the marketing layer.

Each channel has a defined job

Channel	Primary audience	Evidence asset
LinkedIn	Municipal executives	Outcome briefing
Search	Mobility teams	Pilot readiness page
Email	Named public buyers	Procurement checklist
Webinars	Buying committees	Technical evidence session
Innovation platforms	Funding teams	Mobility demonstration
Trade media	Smart city ecosystem	Sustainable city article

Every campaign targets a documented buyer question and a measurable next step.

Metrics connect reach to a pilot decision

CTR
Clicks / impressions
Message response

Engagement
Engaged sessions / sessions
Content relevance

Lead conversion
Qualified leads / sessions
Fit and readiness

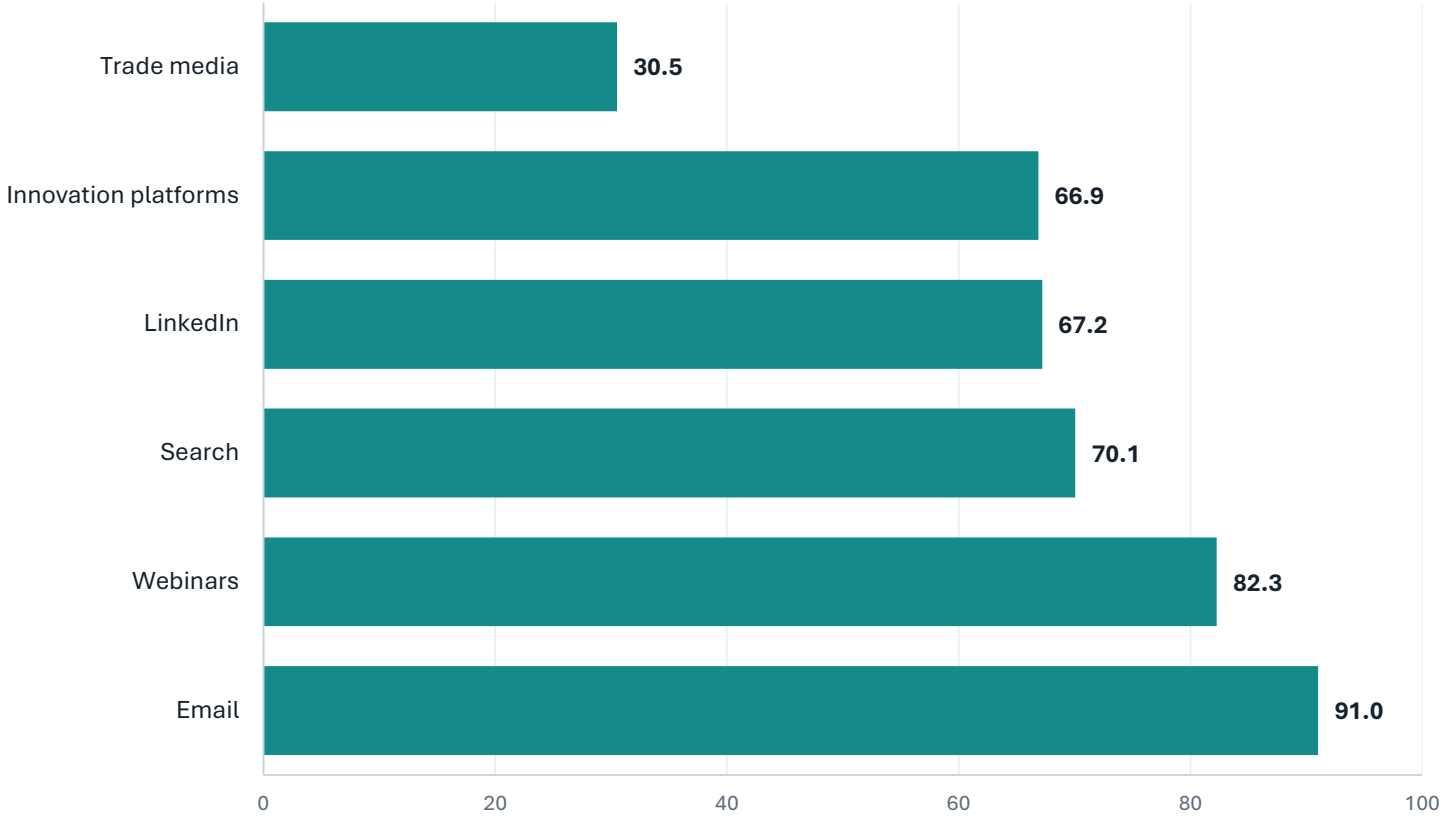

Opportunity conversion
Opportunities / qualified leads
Committee progress

Pilot conversion
Pilot commitments / opportunities
Commercial progress

Cost per opportunity
Spend / opportunities
Pipeline efficiency

UTM labels support campaign reporting. They do not prove consent, identity or causation.

Synthetic results favour high-intent channels

Interpretation

Email and webinars create stronger committee-level progression in the scenario.

Search contributes volume and intent.

Trade media remains an awareness channel with weaker example efficiency.

Synthetic inputs

Budget guidance remains constrained and reviewable

Channel	Share	Budget	Review rationale
Email	19.7%	€11,820	High intent and confidence
Webinars	20.2%	€12,120	Committee engagement
Search	17.2%	€10,320	Intent and volume
LinkedIn	16.5%	€9,900	Executive reach
Innovation platforms	16.4%	€9,840	Procurement relevance
Trade media	10.0%	€6,000	Minimum exploration floor

Final allocation requires sample-size, legal, procurement-stage and claims review.

Marketing and AI claims need explicit controls

Marketing data

01 Purpose and lawful basis

02 Consent-aware tag gating

03 Data minimisation

04 Retention and deletion

05 Aggregate public exports

AI and product claims

01 Intended purpose

02 Evidence status

03 Human oversight

04 Monitoring and fallback

05 Change and incident records

Deployment boundary

01 Safety assessment

02 Security testing

03 Pilot sandbox

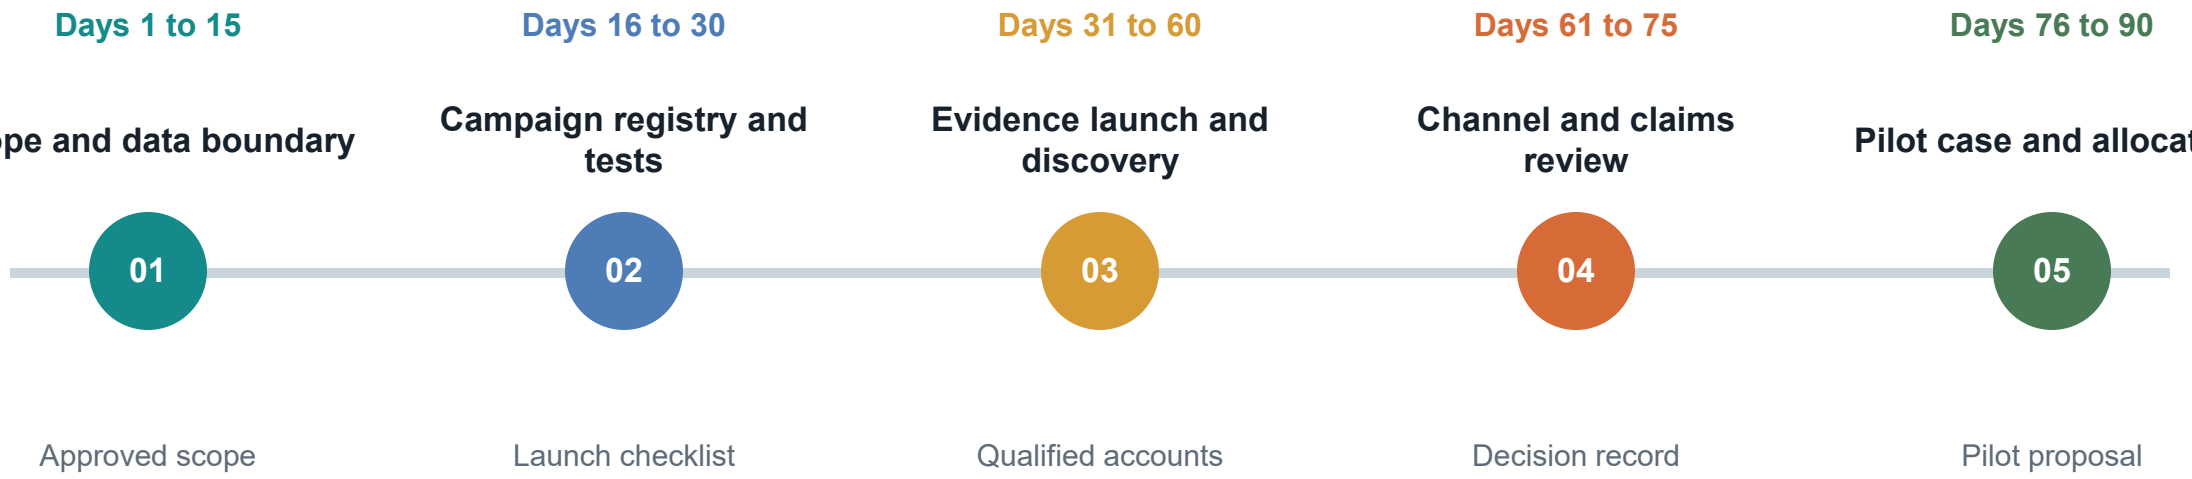

04 Rollback capability

05 Independent legal review

Key risks sit across marketing and deployment

01	**Consent failure**	Optional tags fire before valid preference	**Gate, test and document**
02	**Unsupported claims**	Simulated values appear as product evidence	**Claims register and labels**
03	**Weak attribution**	One channel receives credit for a long committee journey	**Account-stage review**
04	**Biased scaling**	Small samples drive large budget shifts	**Confidence threshold and caps**
05	**System safety**	Live optimisation fails outside tested conditions	**Sandbox, fallback and override**

A ninety-day plan builds evidence before scale

Each phase ends with reviewable evidence. Budget and deployment decisions remain under named human owners.
